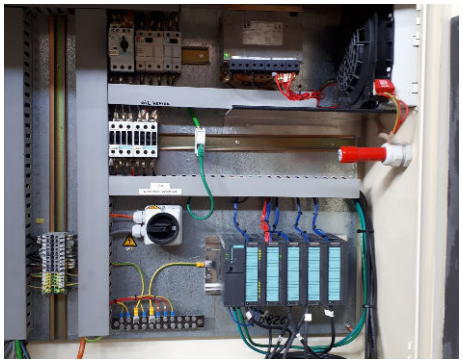
COMPRESSOR CONTROLS

INTRODUCTION

For large-scale users in the industry the realization of the current climate targets is high priority. The quickest and easiest energy savings are realized in the generation of compressed air. When generating compressed air, energy costs amount to 80% of the total cost of ownership.

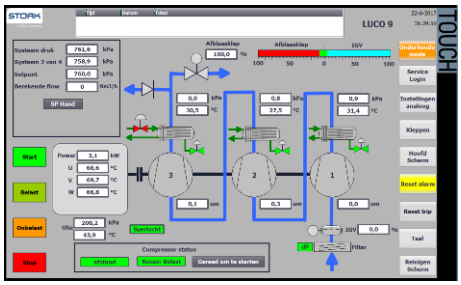
By designing, installing and commissioning custom build compressor controls, which can be built on any brand and type of compressor, Stork provides a system where different compressors work together in the most efficient configuration.

Our customers, where these systems are currently in operation, appreciate that the system is built as an open software platform which can be adapted at any time to facilitate changes that may occur in the process in the coming years.



WHAT DO WE OFFER?

- Conversion of your compressor controls specifically tailored to your customer requirements
- Overarching control systems where existing compressor controls can be operated from.
- Communication protocol: Modbus, Profibus or Ethernet
- Existing panels can be used for the conversion.



TARGET:

- Reduce CO2 emissions of your compressor installation
- More efficient use of your installation
- Combine compressors of different brands with an overarching control system.
- Better insight into the total energy consumption of your compressor installation.
- Different types of compressors can be implemented in the system (Centrifugal screw - piston compressor)
- Open control, no black box.
- Software property of the customer
- Hardware freely available
